

# insullite®

## RECESSED LIGHT PROTECTIVE COVER

The **Insullite** is a fire retardant cover designed to allow the installer to insulate safely and effectively around recessed lights. Research has shown that without proper insulation, areas around recessed lights can allow a large amount of heat energy to enter/escape from a building. However, insulation placed too close to lights can also be a fire hazard.

The **Insullite** is your best insurance against fire caused by heat build-ups due to insulation installed over or too close to recessed lights and other heat producing fixtures. The cover is quick and easy to install by the professional or do-it-yourselfer and is used with all types of insulation, cellulose, fiberglass and rockwool.

When installed, the **Insullite** allows insulation to be placed as close to the light or heat producing fixture as possible without risk of fire.
